Fast Food Density and Low-Income Neighbourhoods in Toronto (2016)

Map showing neighbourhoods with the highest quartile of fast food density and lowest quartile of median household income.
Data sources:City of Toronto, 2016, DMTI 2016, Census of Canada 2016.
Author: Yisi Xie

1) How many lines were created in the OD cost matrix?

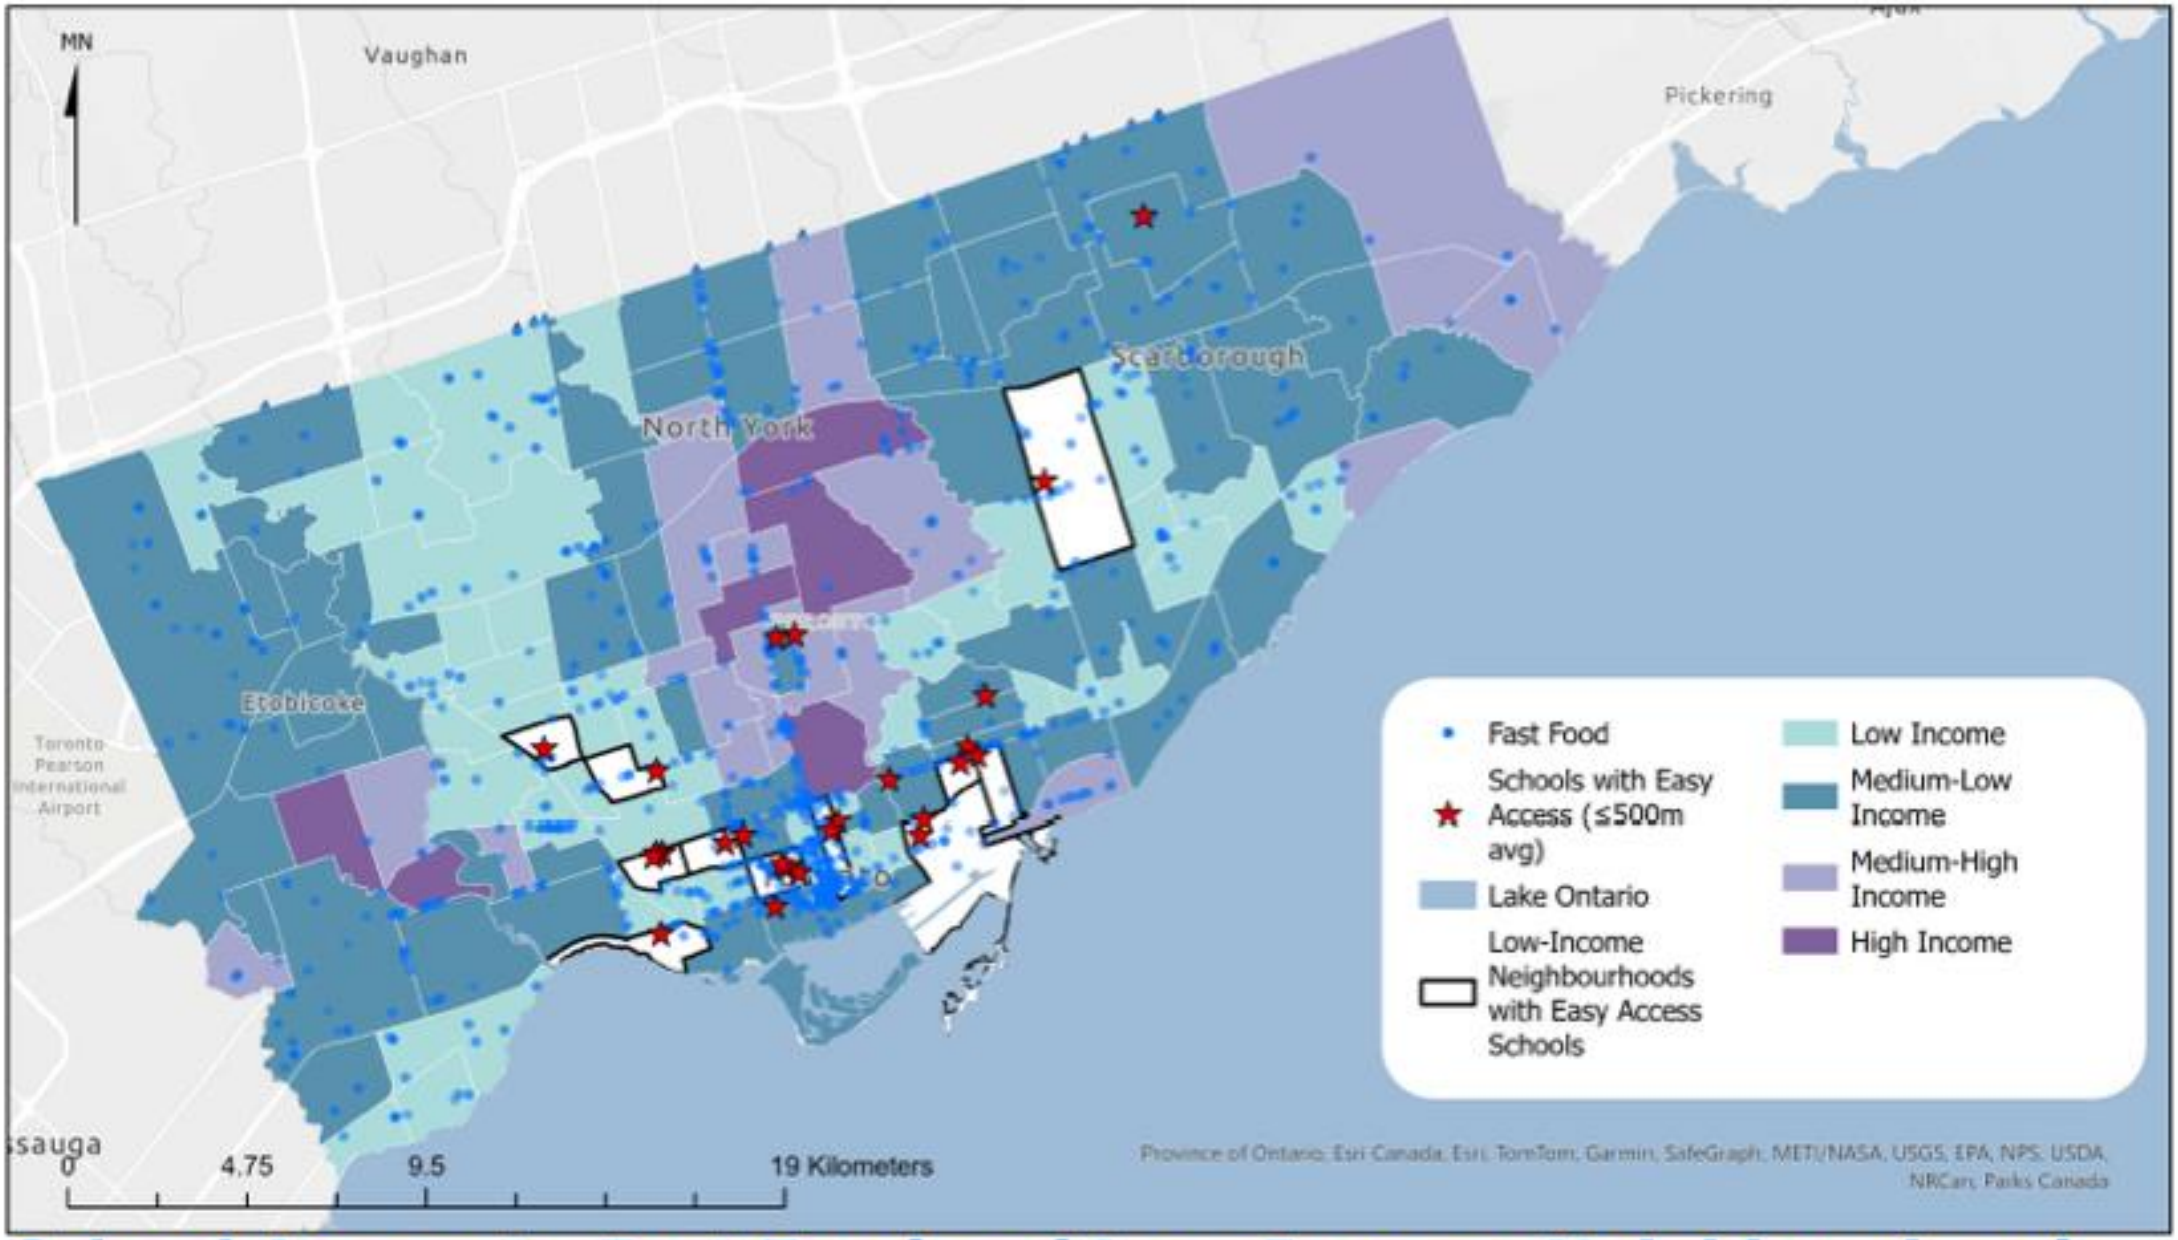
366

2) How many schools are within an average distance of 500 metres to three fast food restaurants?

27

3) How many of these schools are also in a neighbourhood classified as the lowest income (quartile classification)?

18



School Access to Fast Food and Low-Income Neighbourhoods in Toronto (2016)

Fast food access near secondary schools overlaid on neighbourhood median household income.
Data sources: City of Toronto, DMTI 2016, Census of Canada 2016.
Author: Yisi Xie

Report:

This study examined fast food density and access in relation to neighbourhood income in Toronto using 2016 Census and DMTI data.

In Map 1, fast food density per km² was calculated using the container approach and classified into quartiles. Neighbourhood median household income was also classified into quartiles. Results show that 10 neighbourhoods fall within both the highest quartile for fast food density and the lowest quartile for income, concentrated in the downtown core and inner suburbs, including areas such as Moss Park and Kensington-Chinatown.

In Map 2, an Origin Destination Cost Matrix was built using a walking network dataset to calculate distance from each secondary school to the nearest three fast food restaurants. The OD matrix generated 366 lines. After summarizing average distances, 27 schools were found within 500 metres of three fast food restaurants. Of these, 18 are located in the lowest income neighbourhoods.

These findings suggest a pattern of socio-spatial inequity, where lower income neighbourhoods experience disproportionately high fast food exposure both in density and school proximity. This concentration may contribute to health disparities, as residents in these areas have limited access to healthier food alternatives, reinforcing cycles of food insecurity and inequality.
